

```
1  -----
2  Sapient Interview Questions
3  -----
4
5  Core Java
6  -----
7  1. SOLID Principles
8      --> Single Responsibility Principle
9      --> Open-Closed Principle
10     --> Liskov Substitution Principle
11     --> Interface Segregation Principle
12     --> Dependency Inversion Principle
13  2. Design Pattern in Java. Which design pattern you have used in your project?
14  --> Creational Design Pattern
15     --> Factory Design Pattern
16     --> AbstractFactory Design Pattern (means Factory of Factories)
17     --> Builder design pattern (Step by step construction of objects)
18     --> Singleton design pattern (Create single object from a bean)
19     --> Prototype design pattern (Create new objects by cloning. Mainly used when
    object creation is heavy process, so we create objects with the existing object
    itself by copying the existing ones.)
20  --> Behavioural Design Pattern
21     --> Adapter Design pattern
22     --> Bridge Design pattern
23     --> Composite Design pattern
24     --> Decorator Design pattern
25     --> Facade Design pattern
26     --> Flyweight Design pattern
27     --> Proxy Design Pattern
28  --> Structural Design Pattern
29     --> Chain of Responsibility pattern
30     --> Command Pattern
31     --> Interpreter Design pattern
32     --> Iterator Pattern
33     --> Mediator Pattern
34     --> Memento Pattern
35     --> Observer Pattern
36     --> State Pattern
37     --> Strategy Pattern (Decide which algorithm to use on runtime)
38     --> Template Pattern
39     --> Visitor Pattern
40  3. Runtime or Dynamic polymorphism
41  4. Abstraction
42  5. Abstract classes vs Interface
43  5. Create custom Immutable class
44     --> Class should be final so can't be inherited.
45     --> Variables should be private and final.
46     --> There's no setter method to update the values later.
47     --> If there's any object type variable, always return its deep copy in
    constructor and getter method.
48  6. Create custom Singleton class
49     --> static variable should be created to store the Class object.
50     --> Create getInstance() method which contains the logic as if the object is
    already present, will return the same else create new for the first time.
51     --> constructor should be private.
52  6. Volatile Keyword
53     --> In Java, the volatile keyword is a modifier applied to variables. It ensures
    that the value of the variable is always read from and written to the main
    memory, rather than being cached in a thread's local memory (CPU cache).
54     --> Since the purpose of volatile is to control memory access for a specific
    variable, it only makes sense to apply it to variables. Methods and classes don't
    have the same kind of memory access characteristics that variables do.
55  7. Transient Keyword
56     --> transient is a variables modifier used in serialization. At the time of
    serialization, if we don't want to save value of a particular variable in a file,
    then we use transient keyword. When JVM comes across transient keyword, it
    ignores original value of the variable and save default value of that variable
    data type.
57     --> transient keyword plays an important role to meet security constraints. There
    are various real-life examples where we don't want to save private data in file.
    Another use of transient keyword is not to serialize the variable whose value can
    be calculated/derived using other serialized objects or system such as age of a
    person, current date, etc.
```

```

58 --> transient and static : Since static fields are not part of state of the
    object, there is no use/impact of using transient keyword with static variables.
    However there is no compilation error.
59 --> transient and final : final variables are directly serialized by their
    values, so there is no use/impact of declaring final variable as transient. There
    is no compile-time error though.
60 --> // Use of transient has no impact here
61     transient static int l = 40;
62     transient final int m = 50;
63     // Transient variables
64     transient int k = 30; // It will be save as 0 as its default value while
        serialization
65 7. Executor Interface, Future and CompletableFuture and its examples
66 --> Exception handling in CompletableFuture
67 --> handle(), exceptionally(), whenComplete()
68
69 8. Concurrent Execution
70 --> When multiple threads are executing the process concurrently or utilizing the
    same resource.
71 9. Fail safe and Fail fast iterators and its examples. What exception is thrown in
    case of Fail fast iterators?
72 --> ConcurrentModificationException thrown in case of Fail fast iterators if we
    modify object while iterating.
73 --> Fail Safe iterators are iterating over cloned copy of the object and do
    modifications on the original object.
74 10. HashMap Implementation
75 --> HashMap internally uses Array as bucket and if collision occurs, it uses
    LinkedList to store the data means its an array of LinkedList.
76 --> HashMap uses hash() method to get the bucket location then saves the data as
    Map.Entry (which contains both key-value pair).
77     static final int hash(Object key) {
78         int h;
79         return (key == null) ? 0 : (h = key.hashCode()) ^ (h >>> capacity);
80     }
81 --> From Java8, LinkedLists are dynamically replaced with "balanced binary search
    trees" in collision resolution after the number of collisions in a given bucket
    location exceed a certain threshold. This change offers a performance boost,
    since, in the case of a collision, storage and retrieval happen in O(log n).
82 -->
83 11. Hash Collision
84 --> https://www.baeldung.com/java-hashmap-advanced
85 11. Difference or correlation b/w hashCode() and equals() method.
86 --> equals() --> Determines if two objects are equal. The equals() method should
    check the equality of objects as precisely as possible.
87 --> hashCode() --> Returns an integer hash code value for an object, which is used
    to optimize performance when storing objects in hash-based data structures. The
    hashCode() method should return the same value each time it's called, unless the
    object property used in the equals() method is modified.
88 --> These methods are declared in Object class with its default implementation.
    Class which uses hashing based data structures should define its implementation.
89 12. HashMap vs LinkedHashMap implementation and internal working.
90 --> HashMap is array of LinkedList but LinkedHashMap is LinkedList of LinkedList.
91 13. map vs flatmap in Java streams
92 --> List<Integer> flatList
93     = number.stream()
94         .flatMap(list -> list.stream())
95         .collect(Collectors.toList());
96 14. Why Java Stream are called as Lazy loading?
97 --> The Java 8 Streams API is lazy because it's based on a "process-only,
    on-demand" strategy, which means that intermediate operations are not evaluated
    until a terminal operation is invoked. This allows for more efficient processing
    of data by only computing the elements that are necessary to produce the final
    result.
98 14. Fetch duplicates in a list of Integers using Java Stream API
99 --> Set<Integer> set = new HashSet<>();
100 --> List<Integer> duplicates = list.stream().filter(l ->
    !set.add(l)).collect(Collectors.toList());
101
102 15. Fetch unique values in a list.
103 --> list.stream().distinct().collect(Collectors.toList());
104
105 15. Intermediate and terminal operations in Stream API
106 16. What is thread safety

```

```

107     --> To executed by a single thread at a time.
108     --> Use synchronized keyword for thread safety.
109 17. Can we break singleton design pattern? If yes, how??
110     --> Using serialization or cloning of the singleton object.
111     --> We can also use Reflection.
112 18. Functional Interface and its types. Where are we using it??
113     --> Interface having single abstract method and can have any number of static and
        default methods.
114     e.g., Runnable, Callable, Comparator, ActionListener, etc.
115 19. BiPredicate function and its example.
116     --> Function take two parameters and return result as boolean. e.g., Filtering
        Map object using Java stream.
117 20. Use of static and default methods in Functional interface.
118     --> These have been introduced in Java8 which contains implementation of the
        method.
119 21. Checked and Unchecked exceptions.
120 22. Garbage collection and its algorithms.
121     --> Two Types:
122         --> Minor Garbage Collection
123         --> Major Garbage collection
124     --> Two methods System.gc() or Runtime.getRuntime().gc() can be used for Garbage
        collection.
125     --> The call System.gc() is effectively equivalent to the call :
        Runtime.getRuntime().gc()
126     --> Just before destroying an object, Garbage Collector calls finalize() method
        on the object to perform cleanup activities. Once finalize() method completes,
        Garbage Collector destroys that object.
127     --> Algorithm Used: Mark and Sweep algorithm.
128     --> Garbage Collector is an example of Daemon thread.
129
130 24. How to do garbage collection in Java.
131     --> Use finalize() method of Object class.
132 25. Thread Pool in java and its types.
133     --> SingleThreadPoolExecutor()
134     --> FixedThreadPool(n)
135     --> CachedThreadPool()
136     --> ScheduledThreadPool(n) // where n is initial number of threads to be created
        in pool.
137     --> public ScheduledFuture<?> schedule(Runnable command, long delay, TimeUnit
        unit);
138     --> public ScheduledFuture<?> schedule(Callable<V> task, long delay, TimeUnit
        unit);
139     --> public ScheduledFuture<?> scheduleAtFixedRate(Runnable command, long
        initialDelay, long period, TimeUnit unit);
140     --> public ScheduledFuture<?> scheduleWithFixedDelay(Runnable command, long
        initialDelay, long period, TimeUnit unit);
141
142 26. How to execute multiple threads sequentially?
143     --> Use join() method.
144     --> Use SingleThreadPoolExecutor
145 27. Difference b/w java.lang.Thread.join() and java.lang.Thread.yield()
146     --> If a thread A calls join() method then current thread will be waiting till
        thread A is completing its task.
147     --> If any executing thread t1 calls join() on t2 i.e; t2.join() immediately t1
        will enter into waiting state until t2 completes its execution.
148     --> Giving a timeout within join(), will make the join() effect to be nullified
        after the specific timeout.
149     --> If a thread A calls yield() method then thread A will wait until same or
        higher priority threads complete their task.
150
151     public static void yield() [Not throwing any checked exception, also not final]
152     public final void join() throws InterruptedException [join() method is not static
        so can be called using Thread object]
153     public final void join(long millis) throws InterruptedException
154     public final void join(long millis, int nanos) throws InterruptedException
155     public static void sleep(long millis) throws InterruptedException
156     public static void sleep(long millis, int nanos) throws InterruptedException
157
158 28. Thread Life Cycle.
159     --> New
160     --> Active
161     --> Blocked/Waiting
162     --> Timed Waiting

```

```

163 --> Terminated
164 29. Why wait(), notify() and notifyAll() methods are in Object class.
165 --> wait() - Tells the current thread to release the lock and go to sleep until
    some other thread enters the same monitor and calls notify().
166     The wait() method is used to make a thread voluntarily give up its
    lock on an object, allowing another thread to execute code within a
    synchronized block. The thread that calls wait() will enter a waiting
    state until another thread calls notify() or notifyAll() on the same
    object, allowing it to resume execution.
167 --> notify() - Wakes up the single thread that is waiting on this object's
    monitor.
168     The notify() method wakes up one of the waiting threads on the same
    object. If multiple threads are waiting, it is not specified which
    one will be awakened. The awakened thread will then compete for the
    lock on the object.
169 --> notifyAll() - It wakes up all the threads that called wait() on the same
    object.
170     The notifyAll() method wakes up all waiting threads on the same
    object. This can be useful when multiple threads are waiting, and you
    want all of them to be notified simultaneously.
171 --> wait() and notify() work at the monitor level and monitor is assigned to an
    object not to a particular thread. Hence, wait() and notify() methods are defined
    in Object class rather than Thread class.
172 --> wait(), notify() and notifyAll() methods can be called from synchronized
    blocks in Java.
173 https://medium.com/@reetesh043/java-wait-notify-and-notifyall-methods-3d3b511bd3ae
174 27. How to do serialization in Java and its interface?
175 28. How to block serialization in child class if parent class implements
    Serialization?
176 --> Override the writeObject(ObjectOutputStream stream) and
    readObject(ObjectInputStream stream) methods and throw NotSerializationException.
    Also make these methods private in child class.
177 29. Generics in Java. What wildcards are used in it?
178 --> Generics are parameterized types. It adds the type safety feature.
179 --> There are three types of wildcards in Java:
180     □ Unbounded Wildcard (?) --> Used when you don't know or care about the
    specific type of the generic.
181     □ Upper Bounded Wildcard (? extends T) --> Used when you want to restrict
    the type to a specific class or its subclasses.
182     □ Lower Bounded Wildcard (? super T) --> Used when you want to restrict the
    type to a specific class or its supertypes.
183 30. Memory Management in String in Java.
184 --> Java uses String pools.
185 31. Priority Queue and Blocking Queue and its internal working.
186
187
188 Data Structures
189 -----
190 1. Which sorting algorithm you have used?
191 2. What type of algorithm used in Merge Sort?
192 --> Divide and Conquer
193
194
195 Problems:
196 -----
197 1. There is a list of Integer array. Find duplicates in it using Stream API
198 --> Set<Integer> set = new HashSet<>();
199 --> List<Integer> duplicates = list.stream().filter(l ->
    !set.add(l)).collect(Collectors.toList());
200
201 2. There is a String. We have to arrange it using its anagram. Do it either using
    Stream API or data structure. Choose Stream API at first.
202 e.g., dog fog god gof god fool gof loof --> dog god god fog gof gof fool loof
203 --> We can use LinkedHashMap directly
204 -->
205
206 Spring Boot
207 -----
208 1. How to exclude a particular package or class dependency.
209 --> @ComponentScan(excludeFilters = @ComponentScan.Filter(value =
    {KafkaProducer.class})) // Similar for includeFilters
210 --> @ComponentScan(excludeFilters = @ComponentScan.Filter(value =
    {KafkaProducer.class}), basePackages = "com.*") // won't have include

```

```

211 2. Spring profiles
212 --> spring.profiles.active = dev
213     application-dev.properties
214 --> To create profiles in same file
215     #---
216     spring.config.activate.on-profile=dev
217     <List the dev properies>
218     #---
219     spring.config.activate.on-profile=test
220     <List the test properies>
221 3. How to return two different format of response like XML format or JSON format from
    same REST API?
222 --> @RequestMapping(produces = {MediaType.APPLICATION_JSON_VALUE,
    MediaType.APPLICATION_XML_VALUE})
223     Also add Accept header while hitting API as {"Accept": "application/json"}
224 4. Exception Handling in Spring Boot
225 --> For Global exception handling, use @ControllerAdvice and @ExceptionHandler
226     @ControllerAdvice
227     public class GlobalExceptionHandler {
228
229         @ExceptionHandler(value = NoSuchCustomerExistsException.class)
230         @ResponseStatus(HttpStatus.NOT_FOUND)
231         public @ResponseBody ErrorResponse
232             handleException(NoSuchCustomerExistsException ex) {
233             return new ErrorResponse(HttpStatus.NOT_FOUND.value(), ex.getMessage());
234         }
235     }
236 5. Lazy and Eager loading
237 6. @Primary, @Qualifier and @Required annotations
238     --> @Qualifier --> Used for selecting bean in case of ambiguity
239     --> @Primary --> Used for defining primary bean if multiple beans are defined of
    same type. By default primary bean gets injected. if @Qualifier is also present,
    it will be taken into consideration.
240     --> @Required --> Used with Setter methods to inject dependency
241 7. Spring Boot internal working
242     --> It uses spring.factories files present in META-INF folder
243 8. How to create custom exception class?
244 9. Caching in Spring boot. Num cache and Redis cache.
245 10. LRU and LFR in cache.
246     --> LRU : Least Recently Used
247     --> LFU : Least Frequently Used
248 11. Logging in spring boot.
249     --> Using Slf4j and Log4j
250     --> Logger log = LoggerFactory.getLogger(A.class);
251
252 12. How to create Git CI/CD pipeline?
253     --> Using .gitlab-ci.yml file.
254 13. Any recent POC done in SpringBoot?
255     --> Have implemented multitenancy in SpringBoot using Hibernate
    AbstractMultitenancyConnectionProvider class which implements
    MultitenantConnectionProvider interface.
256 14. How to implement Primary key and Composite key in JPA
257 15. Generation strategy in primary key.
258     -->
259 16. Which Repository interface you have used?
260     --> Both JpaRepository<EntityName, PrimaryKeyDatatype> &
    CrudRepository<EntityName, PrimaryKeyDatatype>
261 17. @ConfigurationProperties in SpringBoot
262     --> 1. Create a class to hold your configuration properties. Annotate it with
    @ConfigurationProperties and specify the prefix that will be used to match
    properties from your application.properties or application.yml file
263     --> 2. In your application.properties or application.yml file, add the properties
    that you want to bind to your configuration class:
264     --> 3. In your main application class, add the @EnableConfigurationProperties
    annotation to enable the binding of properties to your class.
265     --> 4. Now you can inject your configuration properties class into any other
    Spring bean and use the values:
266     https://www.baeldung.com/configuration-properties-in-spring-boot
267 17. Entity relationship in JPA
268 18. How JPA assures ACID principle?
269     --> JPA used @Transactional annotation
270     --> Atomicity: Ensures that either all operations in a transaction are completed

```

or none are. If any part of the transaction fails, the entire transaction is rolled back.

271 --> Consistency: Ensures that the database remains in a consistent state before and after a transaction.

272 --> Isolation: Ensures that transactions are isolated from each other until they are complete.

273 --> Durability: Ensures that changes made by a transaction are permanent and survive system failures.

274

275 19. How to handle transaction in SpringBoot?

276 --> @Transactional annotation is used

277 18. How to handle latency issue for some API in SpringBoot?

278 19. 401 and 403 error codes.

279 --> 200 : OK

280 --> 201 : Created

281 --> 202 : Accepted

282 --> 204 : No Content

283 --> 301 : Moved Permanently

284 --> 302 : Found

285 --> 400 : Bad Request

286 --> 401 : Unauthorized

287 --> 402 : Payment Required

288 --> 403 : Forbidden

289 --> 404 : Not Found

290 --> 405 : Method Not Allowed

291 --> 408 : Request Timeout

292 --> 409 : Conflict

293 --> 500 : Internal Server Error

294 --> 501 : Not Implemented

295 --> 502 : Bad Gateway

296 --> 503 : Service Unavailable

297 --> 504 : Gateway Timeout

298

299 20. What API headers you have used??

300 "Content-Type", "Accept", "Authorization"

301

302 21. Log Tracing mechanism

303 22. NFR (Non-Functional Requirements)

304 23. Any production support you have worked on

305 24. FetchType and its multiple values and the default value

306 --> Used in Entity Relationship mapping

307 FetchType.LAZY --> Associative entity will not be loaded with main entity fields. A separate call would be required to fetch the data if needed.

308 FetchType.EAGER --> Associative entity will be loaded alongwith main entity fields.

309

310 25. Transaction handling and its attribute

311 --> @Transactional can only work when SpringBoot main class is annotated with @EnableTransactionManagement

312 26. Test Driven Design pattern

313 27. JUnit annotations

314 28. Difference b/w @Mock and @Spy

315 30. Use of @InjectMocks

316 31. How to test Rest APIs?

317 --> JUnit for Unit testing. We can also use Postman

318 32. Any code quality tool used?

319 --> Sonar Lint (SonarQube)

320 33. Reactive Programming

321 34. Spring Cloud Gateway

322 35. Hibernate First and Second Level Cache

323

324

325

326 SQL

327 -----

328 1. Write a query to fetch 3rd max salary form Employee table.

329

330 2. We have Employee and Department table. Write a query to find the count of employees in a particular department.

331

332

333

334

```

335
336 Microservices
337 -----
338 1. API Gateway
339 2. Service Registry
340 3. Circuit Breaker
341 4. Transaction handling in microservices.
342 5. Inter-service communication
343 6. Design patterns in Microservices
344 7. Saga and Circuit break design patterns
345 8. Log tracing using Grafana, Splunk or Cloudwatch
346 9. Fault tolerance
347 10. How to know if any service is malfunctioning. How do you fix it??
348 11. Time To Live (TTL)
349 12. Orchestration
350 13. GraphQL
351 14. gRPC
352
353
354
355
356 Spring Security
357 -----
358 1. Which mechanism you have used?
359 2. Explain the flow
360 3. JWT and its parameters
361 4. How do you implement Spring Security. Which dependency is required?
362     --> spring-boot-starter-security
363
364
365
366 Cloud
367 -----
368 1. List the AWS services you have used?
369 2. Any serverless service like Lambda
370 3. EKS, Storage service, RDS
371 4. Cloud watch
372
373
374
375 Miscellaneous
376 -----
377 1. Have you participated in code review, Technical design
378 2. Have you created HLD or LLD designs
379 3. Types of diagrams you have created for designing --> Sequence diagram and Flow
380 charts
381 4. Explain any end-to-end flow in your project.
382 5. NFR (Non Functional Requirements like Vulnerability fixes, Performance, etc.)
383 6. What tools have you used for Vulnerability analysis --> Aquasec (SCA), CAST
384 Highlight (SAST)
385 7. How do you conduct performance testing? --> Using Apache JMeter
386 8. Have you done any production deployment?
387 9. How do you implement security in microservices?
388 10. How do you test the application performance?
389
390 -----
391 HCLTech Interview Questions
392 -----
393 1. If one service expects XML response from API and another service expects JSON
394 response. How to implement that?
395 --> @RequestMapping(produces = {MediaType.APPLICATION_JSON_VALUE,
396     MediaType.APPLICATION_XML_VALUE})
397     Also add Accept header while hitting API as {"Accept": "application/json"}
398 2. Program: WAP using Stream API to sum of the digits of an Integer
399 --> int num = 12345;
400 --> int digitSum =
401     String.valueOf(num).chars().map(Character::getNumericValue).sum();
402
403 3. What is API Gateway in microservices and how do you implement it?
404 4. How to implement security in microservices?
405 5. If there are 3 classes having multi-level inheritance. Now if I create object of

```

first class, in which order, constructors will be called?

--> By default child constructor calls parent default constructor at its first statement even if child constructor is parameterized.

6. How can we remove default embedded server in SpringBoot and use some different server like Glassfish or Jetty?

----- Accenture Interview Questions -----

1. What is actuator in Spring Boot?

2. How to reload beans on runtime?

--> @RefreshScope and call /actuator/refresh API (POST)

3. How to execute beans in a specific order?

--> @Order(<Integer value>)

4. @DependsOn annotation

--> To make bean creation dependent on some other bean to be loaded into the context.

5. @ConditionalOnMissingBean

--> The @ConditionalOnBean and @ConditionalOnMissingBean annotations let a bean be included based on the presence or absence of specific beans

6. How do you handle performance in your application?

--> We're using Apache JMeter to run the PTs.

--> Also to improve performance, we generally reduce database hits, adding index in database columns,

--> optimizing code by reducing multiple loops

--> Choosing right data structure,

--> Use caching

----- Indusind Interview Questions -----

1. Do we require same key for encryption and decryption?

--> No, encryption and decryption should use different key as public private key combination.

2. Difference b/w Encryption and Hashing.

3. Possible ways to create Thread in Java.

--> Using Thread class and Runnable interface.

4. How to create Thread object using Runnable interface?

5. What would occur while executing the following code?

```
class ThreadEx extends Thread
{
    public void run()
    {
        System.out.print("Hello...");
    }
    public static void main(String args[])
    {
        ThreadEx T1 = new ThreadEx();
        T1.start();
        T1.stop();
        T1.start();
    }
}
```

--> It will throw java.lang.IllegalThreadStateException exception.

6. What is Executor framework and CompletableFuture future. Write a program for it.

7. How to execute threads sequentially?

-->

8. WAP using Java Stream API to find the second largest salary of the employee.

-->
list.stream().map(Employee::getSalary).sorted(Comparator.reverseOrder()).skip(1).findFirst();
-->
list.stream().sorted(Comparator.comparingInt(Employee::getSalary).reversed()).skip(1).map(Employee::getSalary).findFirst().get();

```

465 -----
466 Wipro Interview Questions
467 -----
468
469 1. What is OAuth2?
470 2. JWT token and its parts.
471 3. How Spring Security is implemented?
472 4. Have you also done basic authentication with Spring Security?
473 5. What is Functional interface? List few functional interfaces.
474 6. What is lambda function?
475 7. Difference b/w Object Oriented and Functional programming.
476 8. What is Thread safety?
477 9. Is ConcurrentHashMap thread safe? --> Yes, it is thread safe because it uses
    synchronization.
478 10. ConcurrentHashMap internal working
479     --> As opposed to the HashTables where every read/write operation needs to
        acquire the lock, there is no locking at the object level in CHM and locking is
        much granular at a hashmap bucket level.
480     --> CHM never locks the whole Map, instead, it divides the map into segments and
        locking is done on these segments. CHM is separated into different
        regions(default-16) and locks are applied to them. When setting data in a
        particular segment, the lock for that segment is obtained. This means that two
        updates can still simultaneously execute safely if they each affect separate
        buckets, thus minimizing lock contention and so maximizing performance.
481     --> No lock is applied on READ operations.
482     -->
        https://anmolsehgal.medium.com/concurrenthashmap-internal-working-in-java-b2a1a48c7289
483 10. What are the new changes done in HashMap implementation in Java8?
484     --> From Java8, LinkedLists are dynamically replaced with "Balanced Binary Search
        Trees" in collision resolution after the number of collisions in a given bucket
        location exceed a certain threshold. This change offers a performance boost,
        since, in the case of a collision, storage and retrieval happen in O(log n).
485 11. How do you write Runnable interface before and after Java8 using Functional
    programming?
486     # Using anonymous inner class
487     --> class MyTask implements Runnable {
488         @Override
489         public void run() {
490             System.out.println("Executing task...");
491         }
492     }
493
494     // Usage
495     Thread thread = new Thread(new MyTask());
496     thread.start();
497
498
499     --> Runnable task = new Runnable() {
500         @Override
501         public void run() {
502             System.out.println("This is a task running on a separate thread");
503         }
504     };
505
506     Thread thread = new Thread(task);
507     thread.start();
508
509     --> After Java8 using Lambda function.
510     --> Runnable task = () -> System.out.println("Executing task with lambda...");
511     Thread thread = new Thread(task);
512     thread.start();
513 12. Difference b/w Callable vs Runnable interfaces.
514 13. Methods of Object class.
515 14. Difference b/w RestTemplate and WebClient.
516 15. Multiple ways for inter service communication.
517     --> RestTemplate, WebClient, Messaging queue, etc.
518 16. What is API Gateway? How do you implement an API Gateway?
519 17. Design patterns in Microservices you have used.
520 18. What is Saga Design pattern?
521     --> Choreography: Used with Message broker like Kafka.
522     --> Orchestration: A centralized service which controls all the services.
523 19. What is Circuit Breaker design pattern? What annotations we have to use to

```

implement it?

20. What is CQRS Design pattern?

--> Command Query Responsibility Segregation.

21. You have Employee class having four fields Id, Name, Gender, Age. You have to find the count of Male and Female employees.

Wipro Interview Questions - Phase 2

1. Rate yourself with Java, SpringBoot and Microservices out of 5.
2. Java 8 features.
3. What is Java stream?
4. Difference b/w HashMap and Hash Table.
5. What is ConcurrentHashMap?
6. What is Singleton design pattern?
7. What do you mean by immutability? How do you implement it at various level?
6. Explain SpringBoot features and how it works internally?
7. What is Spring actuator?
8. What is POM file?
--> Project Object Model
9. Spring profiles.
10. How do handle exception in SpringBoot?
10. What are microservices?
11. API Gateway, Service discovery.
12. How are two services interacting?
--> Using RestTemplate
13. How do you handle transactions in microservices?
14. What is circuit breaker? How do you implement it?
15. Difference b/w final, finally and finalize.

Admiral Group Interview Questions Round-1

1. What are spring.factories? Explain Spring Boot autoconfiguration.
2. What is Spring JPA? How do we add it into Spring Boot project?
--> I missed @EnableJpaRepositories annotation
3. What is Factory Interface?
4. How to create prototype bean in Spring Boot even if the controller is Singleton?
5. How to configure SSL in RestTemplate bean?
6. Kubernetes basic commands.
7. Basic cloud concepts, Availability zones, Region, VPC, Subnet.
8. How do you communicate to other service either through HTTP or HTTPS?
9. How do you handle transaction in SpringBoot?
10. How much deep testing you have done with JUnit?
11. Suppose there's a loop created in your service to add 5 employees in database which hits EmployeeRepository.save() method 5 times.
How do you verify the count of calling EmployeeRepository.save() method if we Mock the repository object?
--> Mockito.verify() [check more on Google]
12. Event driven approach.
13. Which VCS service you're using? Where do you store your JARS and Docker images? Azure Container Registry or something else.
14. Microservices Design pattern. What is orchestration and Choreography?
15. Do the following code:
We have one root dictionary and other is statement. Wherever statement starts with root, replace the word with root. If multiple root matches, pick the one which is smallest in length.
e.g., String[] dict = {"catt", "cat", "dog", "fat"};
String sentence = "fatttt dogggg hello doggtfsg fathjdb catthg fathd the";
Output = "fat dog hello dog fat cat fat the"

Admiral Group Interview Questions Round-2

1. Why do you want to join Admiral?

```

590 2. What are your strengths and weakness?
591 3.
592
593
594
595
596 -----
597 Moglix Interview Questions Round-1
598 -----
599 1. What is abstraction??
600 2. Constructor in Java. If abstract class is having constructor, why couldn't we
    create object from it?
601     --> Abstract class constructor is being used by its child class for getting the
        object. The purpose of an abstract class is to act as a blueprint for other
        classes to inherit from.
602 3. Hash Collision and how HashMap handles it?
603 4. Difference b/w array and ArrayList.
604 5. Is ArrayList thread safe. What error it will throw if I make changes while
    iterating? How can I do use concurrency feature in it?
605     --> Use CopyOnWriteArrayList
606     --> To prevent unsynchronized access to the list, you can use the
        Collections.synchronizedList method when creating the list.
607 6. How do we handle Exception in Java?
608 7. If try, catch and finally are returning some result and error is throwing, which
    block will be executed and if there's no error what will be executed?
609     --> If error is thrown, catch and finally both will be executed.
610     --> If error is not thrown, only finally will be executed.
611 8. Use of final keyword in multiple context. Class, method and variable.
612     --> final at class level stops inheritance.
613     --> final at method level stops overriding.
614     --> final at variable level makes it constant.
615 9. If we declare StringBuilder variable as final, can we use append or delete
    operations?
616     --> yes, we can do because variable will be pointing to the same object.
617 10. How to create our own Immutable and Singleton class?
618 11. Write a program to find the first non-repeating character in String without using
    Collections and Map.
619     --> StringBuilder sb = new StringBuilder();
620         for(int i=0; i<s.length(); i++){
621             int index = sb.indexOf(String.valueOf(s.charAt(i)));
622             if(index != -1){
623                 sb.deleteCharAt(index);
624             } else{
625                 sb.append(s.charAt(i));
626             }
627         }
628         return sb.charAt(0);
629
630 12. Given a array of Integers having numbers from 1 to 100 in sorted order and all
    are unique. But one number is missing. Find that missing number.
631     --> for(int i=1; i<arr.size(); i++){
632         if(arr.get(i-1) != i){
633             return i;
634         }
635     }
636     return 100;
637
638     Note: This can also be done using Binary search.
639
640 13. Difference b/w unique and primary key.
641 14. Indexing in SQL.
642 15. If we have an employee table having id, name, age, gender and salary. Write a
    query to get employee id and name having the second max salary.
643     --> SELECT emp.id, emp.name from employee emp order by salary desc offset 1 limit 1;
644
645 16. Write a query to fetch the list of employees having duplicate name and email
    combination.
646     --> SELECT emp.name, emp.email from employee emp group by emp.name, emp.email having
    count(*) > 1;
647
648 17. Embedded Servers in SpringBoot.
649 18. What is auto configuration in SpringBoot?
650 19. @Qualifier annotation.

```

20. Default bean scope in SpringBoot.
21. Difference b/w Put and Post. Can we replace POST with PUT and vice versa.
22. Dependency Injection and Inversion of Control.
23. Any other way to get the object instead of @Autowired annotation?
24. If the bean is created, where its object is stored. Either in classpath or context?
25. n+1 problem in Hibernate.
26. @Service annotation is used for.

Moglix Interview Questions Round-2

1. What is index in database? Its pros and cons.
2. Triggers in database.
3. Create two tables CUSTOMER and ORDER and write following queries.
Order

order_id --> PK
purchase_date
items
cust_id --> FK

Customer

id --> PK
name
address
contact
email
status -> 0,1
- i. Write a query to fetch the list of customers who don't purchase any order on 17th Sept.
-->
- ii. Write a query to fetch the duplicate email_id in Customer table.
--> select email_id from customer group by email having count(*) > 1;
- iii. Write a query to deactivate duplicate records by updating the status field.
--> UPDATE customer as c1 set c1.status = 0
WHERE EXISTS(
SELECT 1 FROM customer AS c2 WHERE c1.email = c2.email AND c1.id <> c2.id
GROUP BY c2.email HAVING count(*) > 1
);
4. Write a program to reverse the String in the provided integer value chunks.
e.g., String s = "abcdefg"
int chunk = 2
Output --> fgdebca

If chunk = 3, output --> efgbcda

Hughes Systique Interview Questions

1. How HashMap stores data? Explain its internal working.
2. What is hashCode() and equals() method?
3. How hashCode() and equals() method are getting calculated?
4. HashMap vs ConcurrentHashMap. Explain internal working of ConcurrentHashMap and which one is thread safe.
5. What is deadlock? Create one example to represent deadlock situation.
6. Write a program to reverse the order of words in a statement.
e.g., My name is Vishwas Maheshwari
Output --> Maheshwari Vishwas is name My

```

722 -----
723 Wissen Interview Questions
724 -----
725 1. Design your product architecture.
726 2. Design an architecture for the food delivery app.
727 3. What is builder design pattern?
728 4. What is immutability? Make the following class immutable.
729     class Employee{
730         int id; String name; List<Department> departments;
731     }
732 5. How to add multiple database in SpringBoot?
733     Suppose we have five endpoints and 5 databases. Implement the SpringBoot project
734     such that when request comes to endpoint 1, call goes to DB1, similar for others.
735 6. Write a program to get the output string by removing the characters in the
736     original string with the following logic.
737     if A&B are adjacent or C&D are adjacent, remove the combination. Return the
738     result when no such combination left after multiple iterations.
739     e.g., "AABCCDABDB" --> A[AB]C[CD][AB]DB --> "ACDB" --> A[CD]B --> "AB" --> ""
740 7. How spring security works?
741 8. Write a program using Java 8 to find the 3rd largest number.
742 9. Write a program using Java 8 to find the count of each character in String.
743 -----
744 EPAM Interview Questions - Round 1
745 -----
746 1. What is the use of hashCode() and equals() method?
747 2. How to implement class level and object level locks in Java?
748 3. Difference b/w Synchronization and concurrency.
749 2. How HashMap works internally?
750 3. List the collections you have worked on.
751 4. Difference b/w HashMap and ConcurrentHashMap.
752 5. SpringBoot actuator.
753 6. There is a list of integers. You have to find the numbers having 2nd digit is 1.
754     You can't convert this to String and don't use any other collection.
755 7. There is a String of words. You have to get the fourth longest word in which
756     there's a possibility of words with same length and in such case same length word
757     will be treated at same level. Solve using stream API.
758     --> String s = "Hello every two nine seven five nineteen";
759     String[] splitted = s.split(" ");
760     Map<Integer, List<String>> map = Arrays.stream(splitted)
761         .collect(Collectors.groupingBy(String::length, Collectors.toList()));
762     List<String> fourthLongest =
763         map.get(map.entrySet().stream().map(Map.Entry::getKey)
764             .sorted(Comparator.reverseOrder()).skip(3).findFirst().get());
765     System.out.println(fourthLongest);
766 8. What is API Gateway?
767 9. Circuit design pattern and how do you implement it?
768 10. What is spring boot starter?
769 11. Scopes in java from lowest visibility to highest.
770 12. Default scope of bean in SpringBoot.
771 13. Why non-static methods can't be called from static method?
772 14. Any JVM level changes you have done?
773     --> --xxmx256 (OutOfMemoryError - to increase heap memory size, default is 256MB)
774     --> --xss256 (StackOverflow - to increase stack overflow size, default is 256MB)
775 -----
776 EPAM Interview Questions - Round 2
777 -----
778 1. Can a function interface have methods of object class like hashCode(), equals()
779     and toString()?
780 2. List the functional interfaces in Java before Java 8. Also what type of functional
781     interfaces introduced in Java 8?
782 3. Java design patterns.
783 4. Give some example of Flyweight design pattern in Java.
784     --> String pool
785     --> Integer Cache (-128 to 127)
786     --> Enum

```

786 5. What is Optional class? What its purpose? Can we inherit this class?
787 6. What happen if a public method is getting overridden by protected method?
788 --> When overriding a method, the access modifier in the child class can be the
same or more accessible than the parent class.
789 --> This will give compile time error.
790 7. What are SOLID principles?
791 8. What are DRY principles?
792 9. If we have common default methods in two interfaces A and B and class implementing
both, what would happen?
793 --> Compile time error will be thrown. To handle the same we have to implement
the method in class and can use interface implementation by using A.super.grow()
or B.super.grow();
794 10. If we have common static methods in two interfaces A and B and class implementing
both, what would happen?
795 --> It will process without any issue as static methods can be accessed using
interface name.
796
797
798 11. If a Singleton scope class A have used a class B of prototype scope. If we
@Autowire class A in some other class, what will happen?
799 12. How to execute some code after the bean creation and before the bean deletion?
800 13. By default JPA executed queries are accessible in console. How can you disable
this?
801 --> spring.jpa.show-sql=false
802 14. Scenarios when finally block won't get executed?
803 15. Have you accessed any conditional annotations?
804 16. Any NoSQL databases you have used like MongoDB?
805 17. By default spring boot uses tomcat server as its embedded server. If we want to
use some other server like Jetty as embedded server, how to do that?
806 18. If a request is passed through multiple services. At some point of time, request
got failed, how would you know that at which service this request got failed?
807 19. If a service is down or going through some failure. Another service is
continuously hitting it, how would you prevent the hits to the service if it is down?
808 --> By implementing Circuit breaker.
809 20. Are you aware of TDD (Test Driven Design)? How do you implement it?
810 21. How would you do performance testing and integration testing?
811 22. Are you aware of ACID properties of database?
812 23. Which cloud services you have used?
813 24. If EC2 gets down, how do we make sure its data would be preserved?
814 --> Use EBS (Elastic Block Service)
815 25. What's the max file size we can upload on Amazon S3?
816 26. if we want to run the entire project on AWS Lambda. How much max size we can
upload on it?
817 -->
818 27. How to create CI/CD pipeline on Jenkins?
819
820
821
822
823

EPAM Interview Questions - Round 3

UST Global Interview Questions - Round 1

833 1. Adapter Design pattern
834 2. Bridge design pattern
835 3. Diff b/w == and equals.
836 4. CompletableFuture and ExecutorService
837 5. Program: You have a list of numbers. Find the numbers which starts with 1. Use
stream API.
838 6. How do you configure multiple databases in SpringBoot?
839 7. Why String is immutable in Java?
840 8. Difference b/w StringBuilder and StringBuffer.
841 9. Difference b/w Collections and streams.
842
843
844
845

```

846 UST Global Interview Questions - Round 2
847 -----
848 1. We have to migrate a monolithic service to microservices architecture. How would
you do that?
849 2. How would you add validating at entity level. If we want employee name should be
alphanumeric
850 --> Use @Pattern(regex = "A-Za-z") at the entity field level.
851 3. If I want to send my message to a particular partition of Kafka topic. Can I do
that and if yes, then how?
852 4. What type of messages I can send to Kafka?
853 5. What stages are in Kafka?
854 --> Four stages [need to check]
855 6. Difference b/w @Controller, @RestController, @Service and @Repository annotations.
Also can we interchange them?
856 7. Write a program using Java 8 to find the non-repetitive characters in a String.
857
858
859 -----
860 Cognizant Interview Questions
861 -----
862 1. What is the default capacity of ConcurrentHashMap?
863 2. List the design patterns you've used.
864 3. What is OAuth2. How is it working?
865 4. What is JWT?
866 5. Any microservices design pattern you've used?
867 6. Write a program to get the frequency of numbers in the list. Use stream API.
868 7. Stored procedure.
869 8. What is indexing?
870 9. What is CompletableFuture?
871 10. What is Executor framework and difference b/w ExecutorService and
CompletableFuture.
872 11. How @Transactional works internally in SpringBoot?
873
874
875
876
877 -----
878 TSYS Interview Questions - Round 1
879 -----
880 1. Thread Life Cycle.
881 2. How two threads communicate with each other?
882 3. What is Serialization?
883 4. What is the use of serialVersionUID variable?
884 --> serialVersionUID is used to ensure that during deserialization the same class
(that was used during serialize process) is loaded.
885 --> It is created by JVM for the class to validate while deserialization for
confirming the class whether it is same or not. if its different, JVM will throw
InvalidClassException.
886 --> https://www.geeksforgeeks.org/serialversionuid-in-java/
887 5. What is immutability? How to achieve it both at object and class level?
888 6. What do you mean by unreachable catch block?
889 7. Can we write try without catch?
890 8. Is there any scenario where catch block won't get executed?
891 9. What design patterns you have used?
892 10. What do you mean by Lambda function?
893 11. How to create custom Functional interface? @FunctionalInterface is required for
this?
894 12. Which version of Java you have worked on? Have you used Java 11 or 17 as well?
895 13. What is Optional class?
896 13. Write a program to write the numbers in an alternate fashion e.g., first positive
then negative till all the possible combinations. Then add` the rest of them as it is.
897 e.g., Input - [-1, 2, -3, 4, 5, 6, -7, 8, 9]
898 Output - [9, -7, 8, -3, 6, -1, 5, 2, 0]
899 --> Arrays.sort(arr);
900 int i= arr.length-1;
901 int j = 0;
902 int[] res = new int[arr.length];
903 int k = 0;
904 while(j < i) {
905     res[k++] = arr[i--];
906     res[k++] = arr[j++];
907 }
908 return res;

```

14. Write a program to convert the following String by adding frequency to each letter.

```
e.g.,    Input string - abbbccddaaabcccceeff
         Output String - alb3c2d2a3b2c3e2f2
--> String s = "abbbccddaaabcccceeff";
String sBuilder sb = new StringBuilder();
char[] ch = s.toCharArray();
sb.append(ch[0]);
int j = 0;
for (int i = 1; i < ch.length; i++) {
    if (ch[i] != ch[i - 1]) {
        sb.append(String.valueOf(i - j));
        j = i;
        sb.append(ch[i]);
    }
}
sb.append(ch.length - j);
return sb.toString();
```

15. Write a program to reverse the process in the last question. Also consider the frequency in double or triple digits.

```
e.g.,    Input string - al2b13c2d2a3b2c3e2f1
         Output String - aaaaaaaaaabbbbbbbbbbccddaaabcccceef
```

TSYS Interview Questions - Round 2

1. If two services are deploying on Kubernetes and one of the service is dependent on other service for some initial calls, how would you handle this situation?
2. Write OneToMany and ManyToMany entity relationship implementation in Hibernate. Also what is n+1 problem?
3. Internal working of SpringBoot.
- 4.

TSYS Interview Questions - Round 3

1. If some API is taking more than 5sec and you have to find what is causing it? How would you do that? How would you monitor this?
2. Which monitoring tool do you use? Any metrics you have used?
3. How would you do monitoring in Kafka if some message got missed?
4. Have you fixed performance issues?
5. Write a program to find the maximum length of substring having non-repeating characters.

Tech Mahindra Interview Questions

1. Difference b/w Vector and HashMap.
2. ConcurrentHashMap.
3. Java 8 features.
4. Write a program to sort the integer array.
5. Actuator in spring boot.
6. Bean scopes in SpringBoot.
 - > singleton: (Default) Scopes a single bean definition to a single object instance for each Spring IoC container.
 - > prototype: Scopes a single bean definition to any number of object instances.
 - > request: Scopes a single bean definition to the lifecycle of a single HTTP request. That is, each HTTP request has its own instance of a bean created off the back of a single bean definition. Only valid in the context of a web-aware Spring ApplicationContext.
 - > session: Scopes a single bean definition to the lifecycle of an HTTP Session. Only valid in the context of a web-aware Spring ApplicationContext.
 - > application: Scopes a single bean definition to the lifecycle of a ServletContext. Only valid in the context of a web-aware Spring ApplicationContext.
 - > websocket: Scopes a single bean definition to the lifecycle of a WebSocket.

Only valid in the context of a web-aware Spring ApplicationContext.

6. How do you configure datasource in spring boot?
7. How do you capture database password? Which type of vault you use?
8. What is docker? Why do we use it for Microservices?
9. How docker works?
10. How much you are aware of cloud services?
11. Which cloud platform do you use?
12. Difference b/w DROP, DELETE and TRUNCATE.
 - > DROP removes an entire table or database, including its structure.
 - > DELETE removes specific rows from a table while keeping its structure.
 - > TRUNCATE removes all rows from a table while keeping its structure.
13. What's the ideal percentage of Unit test coverage?
 - > 80%

----- Sigmoid Interview Questions - Round 1 -----

1. Difference b/w Concurrency and synchronization.
2. Java 8 features.
3. Difference b/w Vector and ArrayList.
4. DB Query:

There is a customers and orders table. You have to write a query which fetch the list of customers with their total order value for the customers who have placed minimum of three orders in last year and have total order value greater than 5000\$.

```
--> SELECT
    c.customer_id,
    c.customer_name,
    SUM(o.order_value) AS total_order_value
FROM
    customers c
INNER JOIN
    orders o ON c.customer_id = o.customer_id
WHERE
    YEAR(o.order_date) >=
GROUP BY
    c.customer_id
HAVING
    COUNT(o.order_id) >= 3 AND
    SUM(o.order_value) > 5000;
```

5. There is an array representing length of ropes. We have to join all the ropes such that their cost of joining would be minimum. Cost of joining two ropes is the sum of their length. Write a Java program for the same.

```
--> PriorityQueue<Integer> minHeap = new PriorityQueue<>();
    for (int rope : ropes) {
        minHeap.add(rope);
    }

    int totalCost = 0;
    while (minHeap.size() > 1) {
        int rope1 = minHeap.poll();
        int rope2 = minHeap.poll();
        totalCost += rope1 + rope2;
        minHeap.add(rope1 + rope2);
    }

    return totalCost;
```

----- Sigmoid Interview Questions - Round 2 -----

1. Difference b/w SQL and NoSQL databases.
2. If a e-commerce company having two types of records - Users and Products. Where type of database you would prefer for them. Either same type or different.
 - > Users can be save in a structure way, so we can use RDBMS database.

1035 --> Products can be of any type like grocery, electronic, clothing, etc. So its
an unstructured type data which should be stored in unstructured database like
NoSQL.

1036 3. What is Kafka? How it is different from other messaging queues?

1037 4. What is a messaging queue? Where do we use it? What type of problem it is solving?

1038 5. Write a query to find 3 minimum salaries of Employee.

1039 --> select salary form employee order by salary limit 3;

1040 6. Write a program to solve the following problem.

1041 There is an array. You have to replace each of its value by its immediate greater
number.

1042 How do we handle if this could be a circular array or list.

1043

1044 7. Internal working of Spring Boot.

1045 8. How do request flows in Spring Boot controller. Can we make changes in the request
before executing the controller? Also same for Post request

1046 --> Using Interceptor

1047 --> preHandle():

1048 --> afterCompletion():

1049 --> postHandle():

1050 --> In Spring Boot, firstly request comes to dispatcher, then it will redirect
the request based on its path to specific controller and then specific API.

1051

1052

1053 -----

1054 Global Logic Interview Questions

1055 -----

1056 1. Working difference b/w PUT and PATCH

1057 2. Can you write complete CRUD operations?

1058 3. How @Transactional works in SpringBoot?

1059 4. What are starter dependencies in Spring Boot?

1060 5. How do we take our data from on-premises to S3? Explain the approach you will use
for this.

1061 6. Can we create thread pools on our own. If yes, what's the need of Executor
framework?

1062 --> Executor Framework provides a predefined and optimized way of handling thread
pools. We can also create our thread pools but we have to manage it on our own
which requires extra effort. Also Executor framework uses Callable Interface
which can return some result but thread is using Runnable interface which won't
return anything.

1063 7. Where do you use HashSet? Give some real life scenario.

1064 8. When we get 500 error?

1065 9. What is sharding?

1066

1067

1068

1069 -----

1070 Global Logic Interview Questions - Client Round 1

1071 -----

1072 1. Write native query in JPA and how its result set will be captured in an object?

1073 2. You have an array. Now find all possible sub arrays having sum is equal to zero.

1074 3. Implement Circuit Breaker for an API.

1075 4. Can we replace @Repository with @Component or @Service?

1076 5. You have a list of integers. Find the list of even and odd numbers using Java
stream.

1077 6. What is Reactive programming in Java?

1078 7. Different ways of doing inter-service communication.

1079 --> RestTemplate, HttpClient, WebClient

1080 8. What is WebClient and how to do synchronous call with it?

1081 9. What type of data return by WebClient? Difference b/w Mono and Flux.

1082

1083

1084

1085 -----

1086 Global Logic Interview Questions - Client Round 1

1087 -----

1088 1. If I want to limit a service to accept only 1000 records at a time. How can we
achieve this?

1089 2. Any production issues you have faced?

1090 3. In case of heavy data loads, what kind of issues you have faced and how would you
fix it?

1091

1092

1093

```
1094 -----
1095 Amerprise Interview Questions

1099
1100
1101
1102 -----
1103 Infosys Interview Questions
1104 -----
1105 1. How do we handle the transactions in Spring JPA?
1106 --> @Transactional
1107
1108
1109
1110 -----
1111 Cubastion Interview Questions - Round 1
1112 -----
1113 1. Working of Oauth2 mechanism.
1114 2. Design principles of microservices.
1115 3. Difference b/w SQL and NoSQL databases. Which would you prefer and in what
1116 scenarios?
1117 --> I've to share some real life scenarios.
1118 4. What's the latest challenge you've faced in your project and how did you solve
1119 that?
1120 5. Difference b/w Service Discovery and API Gateway?
1121 6. You have the following classes.
1122 class A{
1123     public void print(){
1124         System.out.println("print function of A")
1125     }
1126     public void display(){
1127         System.out.println("display function of A")
1128     }
1129 }
1130 class B extends A{
1131     public void print(){
1132         System.out.println("print function of B")
1133     }
1134     public void empty(){
1135         System.out.println("empty function of B")
1136     }
1137 }
1138 Can I do the following?
1139 a) A a = new B();
1140 b) B b = new A(); // Compilation
1141 c) B b = (B) new A();
1142
1143 7. There is a Car class having fields as id, engineNo & companyName, and you have a
1144 car list and list of companies as below.
1145 List<Car> carList;
1146 List<String> companies = List.of("Tesla", "BMW", "Ford");
1147 Write a program to sort the cars in the order of companies name.
1148 --> carList.stream().sorted(Comparator.comparing(car ->
1149     companies.indexOf(car.getCompanyName()))).collect(Collectors.toList());
1150
1151 8. If we have to make 10000 request to some microservice. How would you handle it?
1152
1153 -----
1154 Cubastion Interview Questions - Round 2
1155 -----
1156 1. Implement GraphQL
1157 2. Redis Cache implementation
1158 3. CI/CD pipeline complete implementation
1159 4. Entity Relationship implementation
1160 5. Working of SpringBoot
1161 6. Stream API Questions
1162     a. You have a list of employees. Find the list of employee name group by their
1163        salary using Java stream.
```

- 1162 b. Do the first one without using Collectors.groupingBy().
- 1163 c. Find the list of employee names using java stream.
- 1164 7. How would you implement RBAC in your services?

1165
1166

1167 -----
1168 Moptra Interview Questions - Round 1
1169 -----

1170 docker compose
1171 Spring Batch
1172 Hibernate n+1 problem.
1173 docker compose

1174
1175
1176

1177 -----
1178 Moptra Interview Questions - Round 2
1179 -----

- 1180 1. If an API is being called from one service to other but it is getting failed after a certain timeout. I want to have a retry mechanism to hit API three times before returning the response. How can I do this in Spring Boot?
- 1181 --> Use @Retryable annotation [Check more on this]
- 1182 2. Difference b/w docker compose and Dockerfile.
- 1183 3. How Kubernetes works?
- 1184 4. How do you handle performance issues?
- 1185 5. If there are 10000 records. Which data structure would you use for storing it so that it can be fetched easily?
- 1186 --> I would prefer HashMap as it gives O(1) time in insertion and retrieval.
- 1187 6. Can we have two services deployed in a single pod?
- 1188 7. Spring Batch
- 1189 8. You have a Student table having fields as id, name, math_score, hindi_score, science_score, exam_date. Write a query to fetch the employees having average score is greater than 70 and exam date is greater than 1-Jan-2020.
- 1190 --> select * from student where (math_score + science_score + hindi_score)/3 > 70
 and exam_date > '01-01-2020';
- 1191 9. Write a program using Java stream to reversing each word of a sentence.
- 1192 e.g., "My name is Vishwas" --> "yM eman si sawhsiV"
- 1193 --> s.chars().mapToObj(c -> (char)c).map(st -> new
 StringBuilder(st).reverse().toString()).collect(Collectors.joining(" "));

1194
1195

1197 -----
1198 IRIS Interview Questions
1199 -----

- 1200 1. Race conditions in multithreading.
- 1201 2. n+1 problem in Hibernate
- 1202 3. save() vs saveAndFlush() methods of JPA.
- 1203 4. Stream vs Parallel Stream
- 1204 5. You have two arrays. Write a code using Java stream to merge them, sort it and generate the unique elements.
- 1205 6. You have two methods. Method1 is generating odd numbers, method2 is generating even numbers. You have to generate the number sequence as 1,2,3,4,5,6 using multithreading without using synchronization.
- 1206 7. What is hashing?
- 1207 8. Which algorithm being used by Stream.sorted() for sorting?

1208
1209
1210

1211 -----
1212 Amantya Interview Questions - Round 1
1213 -----

- 1214 1. Iterator vs Spliterator
- 1215 2. Iterator vs ListIterator
- 1216 3. Fail Fast vs Fail Safe Iterators
- 1217 4. Difference b/w Stream and Collection
- 1218 5. Java Design patterns.
- 1219 6. There is a network having some failure occurred. You have to see the live logs for it. Which design pattern would you use for this.
- 1220 --> Observer pattern as it notifies all the components or classes linked if there is any state change. It will work like when a new log is added, it will inform the service like Splunk to retrieve the same.
- 1221 8. List the consumer and supplier methods of stream API.

```

1222     --> forEach(Consumer<?>)
1223     --> generate(Supplier<?>)
1224     --> filter(Predicate<?>)
1225     --> Collectors.partitioningBy(Predicate<?>, Collectors<?>)
1226     --> map(Function<?>)
1227 9. What is Actuator in SpringBoot?
1228 10. Can you create the custom actuator?
1229 11. How to create custom annotation in Java?
1230 11. List 4 differences b/w REST and SOAP services.
1231 12. Types of HTTP Methods. Difference b/w POST and PUT methods. Give me 4 differences.
1232 13. Difference b/w PUT and PATCH methods.
1233 14. If we save anything in SpringBoot, it automatically reload the changes and
1234 restart the application. How would SpringBoot does that?
1235 --> Key points about how it works:
1236     --> Dependency inclusion:
1237         To enable this feature, add the spring-boot-devtools dependency to your
1238         project.
1239     --> File monitoring:
1240         When you save a code change, the DevTools automatically detects the
1241         modification.
1242     --> Optimized restart:
1243         Instead of a full application restart, DevTools uses a custom classloader
1244         to reload only the changed classes, significantly reducing restart time.
1245     --> Configuration options:
1246         You can further customize the behavior with properties like
1247         spring.devtools.restart.enabled to control whether automatic restarts are
1248         enabled and spring.devtools.restart.exclude to specify files that should
1249         not trigger a restart.
1250 15. List 5 differences b/w Spring and SpringBoot.
1251 16. Is there any other way to configure database in Spring Boot without using
1252 configuration in application.properties?
1253 17. Implement Circuit Breaker in SpringBoot. Do step by step process.
1254 18. Design patterns of Microservices.
1255
1256 19. Write a program using Java 8 streams for fetching the unique characters in String.
1257
1258 20. If a request flows through multiple services and fails at any of it. How would
1259 you trace the request without using log monitoring?
1260     --> traceId and spanId
1261
1262 21. Difference ways to create singleton design pattern.
1263
1264 -----
1265 Amantya Interview Questions - Round 2
1266 -----
1267 1. How do you write native queries in Spring JPA? Also how to map its response to an
1268 object?
1269 2. How do we call b/w services in Microservices architecture?
1270     --> RestTemplate, HttpClient and WebClient
1271 3. Difference b/w RestTemplate, HttpClient and WebClient?
1272     --> RestTemplate : blocking synchronous communication.
1273     --> HttpClient : Introduced in Javall. Also, provide more closed control to the
1274     call. It won't contains any serialization mechanism.
1275     --> WebClient : Non-blocking asynchronous. It uses reactive framework and
1276     returns Mono and Flux type objects. Can make it synchronous by calling block()
1277     method.
1278 4. How to make WebClient call synchronous and what it is returning?
1279     --> block() method is used to make WebClient call synchronous. It returns Mono<?>
1280     object for single value. If list, it will return Flux<?>.
1281 5. You have a list of Integer. Write a program using Stream to filter the even no.
1282     --> List<Integer> evenNoList = list.stream().filter(i ->
1283         i%2==0).collect(Collector.toList());
1284     --> List<Integer> evenNoList =
1285         list.stream().filter(this::validateEven).collect(Collector.toList()); //Method

1344 4. How to create your own spring boot starter?

```

```

1343 5. Pub-Sub vs Messaging queue.
1344 --> Message queues consist of a publishing service and multiple consumer services
      that communicate via a queue. This communication is typically one way where the
      publisher will issue commands to the consumers. The publishing service will
      typically put a message on a queue or exchange and a single consumer service will
      consume this message and perform an action based on this.
1345 --> Conversely, to message queues, in a pub-sub architecture we want all our
      consuming (subscribing) applications to get at least 1 copy of the message that
      our publisher posts to an exchange.
1346 --> https://www.baeldung.com/pub-sub-vs-message-queues
1347 6. Difference b/w Arrays.asList() and List.of()
1348 --> Arrays.asList() |
      List.of() |
1349 ----- |
      ----- |
1350 1. Introduced in Java 8. | 1.
      Introduced in Java 9.
1351 1. Can contains null values | 1.
      Can't contain Null values
1352 2. Elements can be modified but can't be added or removed. | 2.
      Immutable(no modifications allowed)
1353 3. Fixed Size | 3.
      Fixed size
1354 4. Backed by an array. Any changes made to the array or list | 4.
      Not backed by any array.
1355 affect the both
1356
1357 7. Circular Dependency In SpringBoot
1358 --> Exception occurred BeanCurrentlyInCreationException
1359 --> Use @Lazy with any of the bean while using Constructor injection. It will
      create a proxy bean to be loaded and later load the actual bean on its first call.
1360 --> Use Setter injection because circular dependency is occurring while using
      Constructor injection.
1361 --> Use @PostConstruct to initialize the dependent bean post the bean
      initialization.
1362 https://www.baeldung.com/circular-dependencies-in-spring
1363 --> We can also use the property to resolve the circular dependency.
1364 spring.main.allow-circular-references=true
1365
1366 8. Comparator vs Comparable
1367 Comparable --> new T1().compareTo(new T2());
1368 Comparator --> Comparator.compare(Object o1, Object o2);
1369 9. Why is Enum required in Java?
1370 --> Type Safety: Enums provide type safety, ensuring that only valid values are
      assigned to a variable. This prevents accidental errors caused by using incorrect
      string or integer values.
1371 --> Readability: Enums make code more readable and self-explanatory. Instead of
      using magic numbers or strings, you use meaningful names that represent the
      values.
1372 --> Maintainability: Enums make code easier to maintain. If you need to add or
      modify a constant, you only need to change it in one place (the enum declaration)
      instead of searching and updating multiple occurrences throughout the code.
1373 --> Enhanced Functionality: Enums are more than just constants. They can have
      methods, constructors, and even fields. This allows you to associate additional
      behavior or data with each constant.
1374 --> Iteration: You can easily iterate over the values of an enum using a loop or
      the values() method.
